The Specification

Please replace the paragraph at p. 48, line 23 – p. 49, line 10 with the following paragraph:

If a user or trusted application desires to export trusted application secrets from a source trusted application to a destination trusted application, the trusted core checks to ensure that the manifest identifier of the desired destination trusted application is included in export statement list portion 458~~758~~. If the manifest identifier of the desired destination trusted application is included in export statement list portion 458~~758~~, then the trusted core allows the destination trusted application to have access to the source trusted application secrets; otherwise, the trusted core does not allow the destination trusted application to have access to the source trusted application secrets. Thus, although a user may request that trusted application secrets be exported to another trusted application, the party that generates the manifest for the trusted application has control over whether the secrets can actually be exported to the other trusted application.
